Semi-Bulk Systems, Inc.

Introducing Modular Processes - NOW and for the FUTURE.

Based on today's rapidly changing process demands, manufacturers must meet the capability to produce a new product now that cannot be processed with traditional process equipment. Quite often, the justification to provide the ideal process is limited since the volume is initially low.

Semi-Bulk Systems' modular process designs allows the manufacturer to buy a limited process capability to meet the immediate new requirement and project justification, but take advantage of the system ability and flexibility to expand to handle additional new ingredients, new product introductions and increasing volumes.

Beverage Mix Process

New Beverage introductions require new or additional process requirements:

- To handle changing ingredients that cannot be mixed efficiently with existing batching station
- To handle bulk bag addition of ingredients as well as small packages for dry and liquid minors
- To handle bulk truck or silo supply for sucrose or other high volume dry ingredients.

If you cannot justify the installation of a process that will meet your FUTURE needs, in addition to your NOW requirements, you can select the **VACUCAM® Ejector Mixer Dynamic Batching Station** that will meet all of your NOW requirements at a competitive price, but can grow in stages to meet all of your future requirements.

The Systems' modular functionality allows the addition of sub processes to meet growing requirements of new beverage ingredients-- This includes all difficult to mix ingredients as well as the capability to handle bulk containers or total bulk supply of ingredients.

BEVERAGE MIX STATIONS

You have an immediate need to handle a sugar substitute (dextrose or e-tol) for making a new product. You know products in the near future will also be supplied in bulk bags or paper bags (citric acid, sodium benzoate, taurine, aspartame, tea powder, etc) and that sucrose in bulk supply will also require processing. You may also have future requirements to handle a variety of gums and thickeners, dry milk powders, liquid flavors and other new ingredients.

Semi-Bulk Systems can provide a process addition that will allow you to meet NOW requirements with a basic unit, and all FUTURE changes

in products or volumes with standard Module additions.

[SUGAR PROCESS MODULES](#)

Semi-Bulk Systems has developed modular sugar liquefaction processes to provide the most efficient processes to handle NOW requirements and to expand to accommodate the rapid and unknown demand in the FUTURE.

The Modular schematic matrix of process options recently presented addresses SBS' capability to provide the complete turnkey process design. From the total dry side capability w/ bulk bags, w/ bulk truck or bulk rail unloading, silo storage, conveying and transfer to process area. The total expertise of dry side handling will provide all of the safety design considerations to meet new explosion design guidelines, humidity control in storage and bulk conveying of dry ingredients. Experience in bulk bag handling and rapid handling unload stations complement our "total solution" for sugar handling and also offers options for additional utilization of the system for other bulk bag ingredients.
